Tropical Storm Alert – Madagascar & Mozambique

Valid: For a week (from 10 February to 15 February 2026)

Affected Areas

Eastern and central Madagascar, extending westward to coastal districts; secondary risk for southern Mozambique Channel and Inhambane coastal areas.

Hazard Types

Tropical Storm Conditions, Heavy to Intense Rainfall, Flash Flooding, Coastal Flooding, Damaging Winds

Hazard Summary

Satellite and forecast model guidance indicate an active Tropical Storm tracking west-southwest across eastern Madagascar into the Mozambique Channel. The system is producing organized deep convection with bands of heavy rainfall and strengthening wind fields. Intense short-duration downpours may trigger flash flooding in low-lying, urban, and riverine areas, while saturated slopes raise localized landslide risk. Coastal districts face rough seas, high waves, and minor storm surge impacts. Conditions may deteriorate rapidly over the week.
