

Heavy Rainfall in Indonesia

Affected Areas

Southern and eastern Kalimantan (around Banjarmasin), Java Sea, central to eastern Java (including Yogyakarta–Surabaya corridor), Bali (Denpasar)

Hazard Types

Heavy rainfall leading to flooding/landslides

Hazard Duration

31-01-2026 to 04-02-2026

Summary

A widespread zone of enhanced rainfall and convective activity is affecting Indonesia as indicated by extensive cloud cover and high-precipitation signals over land and surrounding seas. These conditions raise the risk of moderate to heavy rainfall, localized flash flooding, urban inundation, and landslides in hilly and vulnerable areas. Authorities and communities are advised to remain alert, monitor official weather updates, and take precautionary measures in flood- and landslide-prone zones.
