## Potential Mid-January Weather Influence from Europe to Pakistan

Valid: From 18-20 January 2026

### Affected Areas

Overall Pakistan

### Hazard/Advisory Types

Rainfall, snowfall in high altitudes and Cold conditions

### Hazard/Advisory Summary

A strong upper-level trough within an amplified jet stream is affecting southern Europe. North Atlantic blocking is directing cold Arctic air into the Mediterranean, supporting active winter systems. The trough is forecast to move eastward across the Balkans into West Asia. Associated upper-air energy may support Western Disturbance development over Iran and Afghanistan by mid-January. Enhanced Western Disturbance influence may affect northern and western Pakistan, bringing light to moderate rain, snowfall at higher elevations, and a brief temperature drop. Overall impacts are expected to remain moderate.
